7. Photo Quality Analysis:

a. Film quality was rated good. Discrepancies reported were:

(1) Several metering malfunctions at mode changes. This is considered normal by the camera manufacturer.

(2) High obliques were a little fuzzy.

(3) Splice broke at tail.

(4) Approximately 12 frames of handling marks.

b. The Immediate Photo Interpretation Report (IPIR) submitted by [redacted] reported the over-all photographic interpretability as fair to poor with 70% cloud cover. Photography was obtained of 31 targets. Breakdown was five good, 9 fair and 17 poor. All photographs were obliques ranging from 14 to 42 NM out from the aircraft. The good pictures were in clear weather 14-24 NM out, however, ten other targets in clear weather were rated poor or fair from 18-42 NM away. Cloud cover was a definite factor in obtaining interpretable photos for the remaining targets. The "H" configuration operated satisfactorily although there were slight pitch and roll fluctuations during the entire flight.

25X1

8. Maintenance: Article [redacted] flew this mission as scheduled. The only discrepancy reported was pitch and roll wallow. The correction made was adjustments to the autopilot on those axes.
